Abstract

This vignette shows and executes the code presented in the manuscript *Using R for proteomics data analysis*. It also aims at being a general overview useful for new users who wish to explore the R environment and programming language for the analysis of proteomics data.

Keywords: bioinformatics, proteomics, mass spectrometry, tutorial.

1 Introduction

This document illustrates some existing R infrastructure for the analysis of proteomics data. It presents the code for the use cases taken from [7].

There are however numerous additional R resources distributed by the Bioconductor¹ and CRAN² repositories, as well as packages hosted on personal websites. Section 7 on page 35 tries to provide a wider picture of available packages, without going into details.

1.1 General R resources

The reader is expected to have basic R knowledge to find to document helpful. There are numerous R introductions freely available, some of which are listed below.

From the R project web-page:

- An Introduction to R is based on the former Notes on R, gives an introduction to the language and how to use R for doing statistical analysis and graphics. [browse HTML | download PDF]
- Several introductory tutorials in the contributed documentation section.

Relevant background on the R software and its appplication to computational biology in general and proteomics in particular can also be found in [7]. For deatils about the Bioconductor project, the reader is referred to [9].

1.2 Getting help

All R packages come with ample documentation. Every command (function, class or method) a user is susceptible to use is documented. The documentation can be accessed by preceding the command by a ? in the R console. For example, to obtain help about the library function, that will be used in the next section, one would type ?library. In addition, all Bioconductor packages come with at least one vignette (this document is the vignette that comes with the RforProteomics package), a document that combines text and R code that is executed before the pdf is assembled. To look up all vignettes that come with a package, say RforProteomics and then open the vignette of interest, one uses the vignette function as illustrated below. More details can be found in ?vignette.

```
## list all the vignettes in the RforProteomics
## package
vignette(package = "RforProteomics")
## Open the vignette called RforProteomics
vignette("RforProteomics", package = "RforProteomics")
## or just
vignette("RforProteomics")
```

http://www.bioconductor.org

²http://cran.r-project.org/web/packages/

R has several mailing lists³. The most relevant here being the main R-help list, for discussion about problem and solutions using R. This one is for general R content and is not suitable for bioinformatics or proteomics questions.

Bioconductor also offers several mailing lists⁴ dedicated to bioinformatics matters and Bioconductor packages. The main Bioconductor list is the most relevant one. It is possible to post⁵ questions without subscribing to the list.

It is important to read and comply to the posting guides (here and here) to maximise the chances to obtain good responses. It is important to specify the software versions using the sessionInfo() functions (see an example output at the end of this document, on page 38). It the question involves some code, make sure to isolate the relevant portion and report it with your question, trying to make your code/example reproducible⁶.

All lists have browsable archives.

1.3 Installation

Since the package is not yet in the stable branch of Bioconductor, it is not yet possible to use its automatic installation and update framework unless one uses the development version of R. An ad hoc script is however available to facilitate installation of RforProteomics and all dependencies. See http://lgatto.github.com/RforProteomics/ for details. The script installs missing dependencies and then RforProteomics, which can then be loaded with

```
library("RforProteomics")

This is the 'RforProteomics' version 0.2.2.
Run 'RforProtemics()' in R or visit
'http://lgatto.github.com/RforProteomics/' to get started.
```

1.4 External dependencies

Some packages used in the document depend on external libraries that need to be installed prior to the R packages:

- mzR depends on the Common Data Format⁷ (CDF) to CDF-based raw mass-spectrometry data. On linux, the libcdf libraries are required. On debian-based systems, for instance, you will need to install netCDFlibnetcdf-dev, netcdf-dev and netcdf-bin.
- IPPD (and others) depend on the XML package which requires the libxml2 infrastructure on linux. On debian-based systems, you will need to install libxml2-dev.
- biomaRt performs on-line requests using the curl⁸ infrastructure. On debian-based systems, you will need to install libcurl-dev or libcurl4-openssl-dev.

```
3http://www.r-project.org/mail.html
4http://bioconductor.org/help/mailing-list/
5http://bioconductor.org/help/mailing-list/mailform/
6https://github.com/hadley/devtools/wiki/Reproducibility
7http://cdf.gsfc.nasa.gov/
8http://curl.haxx.se/
```

1.5 Obtaining the code

The code in this document describes all the examples presented in [7] and can be copy, pasted and executed. It is however more convenient to have it in a separate text file for better interaction with R (using ESS⁹ for emacs or RStudio¹⁰ for instance) to easily modify and explore it. This can be achieved with the Stangle function. One needs the Sweave source of this document (a document combining the narration and the R code) and the Stangle then specifically extracts the code chunks and produces a clean R source file. If the package is installed, the following code chunk will create a RforProteomics.R file in your working directory containing all the annotated source code contained in this document.

Alternatively, you can obtain the Rnw file on the github page https://github.com/lgatto/RforProteomics/blob/master/inst/doc/vigsrc/RforProteomics.Rnw.

1.6 Prepare the working environment

The packages that we will depend on to execute the examples will be loaded in the respective sections. Here, we pre-load packages that provide general functionality used throughout the document.

```
library("RColorBrewer") ## Color palettes
library("ggplot2") ## Convenient and nice plotting
library("reshape2") ## Flexibly reshape data
```

2 Data standards and input/output

2.1 The mzR package

The mzR package [3] provides a unified interface to various mass spectrometry open formats. This code chunk, taken mainly from the openMSfile documentation illustrated

⁹http://ess.r-project.org/
10http://rstudio.org/

how to open a connection to an raw data file. The example mzML data is taken from the msdata data package. The code below would also be applicable to an mzXML, mzData or netCDF file.

```
## load the required packages
library("mzR") ## the software package
library("msdata") ## the data package
## below, we extract the releavant example file
## from the local 'msdata' installation
filepath <- system.file("microtofq", package = "msdata")</pre>
file <- list.files(filepath, pattern = "MM14.mzML",</pre>
    full.names = TRUE, recursive = TRUE)
## creates a commection to the mzML file
mz <- openMSfile(file)</pre>
## demonstraction of data access
basename(fileName(mz))
[1] "MM14.mzML"
isInitialized(mz)
[1] TRUE
runInfo(mz)
$scanCount
[1] 112
$lowMz
[1] 0
$highMz
[1] 0
$dStartTime
[1] 270.3
$dEndTime
[1] 307.7
$msLevels
[1] 1
instrumentInfo(mz)
$manufacturer
[1] "Unknown"
$model
```

```
[1] "instrument model"

$ionisation
[1] "electrospray ionization"

$analyzer
[1] "mass analyzer type"

$detector
[1] "detector type"

## once finished, it is good to explicitely close
## the connection
close(mz)
```

mzR is used by other packages, like MSnbase [8], TargetSearch [5] and xcms [11, 1, 12], that provide a higher level abstraction to the data.

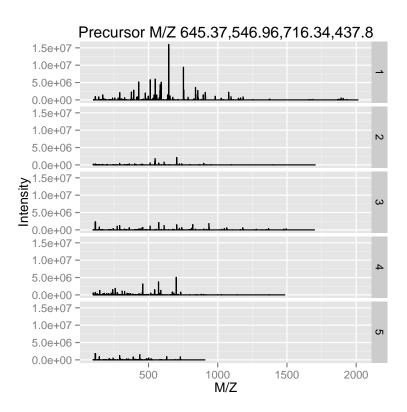

3 Raw data abstraction with MSnExp objects

MSnbase [8] provides base functions and classes for MS-based proteomics that allow facile data and meta-data processing, manipulation and plotting (see for instance figure 1 on page 9).

```
library("MSnbase")
## uses a simple dummy test included in the
## package
mzXML <- dir(system.file(package = "MSnbase", dir = "extdata"),</pre>
    full.name = TRUE, pattern = "mzXML$")
basename(mzXML)
[1] "dummyiTRAQ.mzXML"
## reads the raw data into and MSnExp instance
raw <- readMSData(mzXML, verbose = FALSE)</pre>
raw

```

plot(raw, full = TRUE)

plot(raw[[3]], full = TRUE, reporters = iTRAQ4)

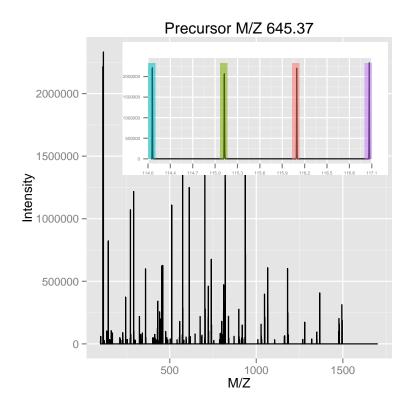

Figure 1: The plot method can be used on experiments, i.e. spectrum collections (left), or individual spectra (right).

3.1 mgf read/write support

Read and write support for data in the mgf¹¹ and mzTab¹² formats are available via the readMgfData/writeMgfData and readMzTabData/writeMzTabData functions, respectively. An example for the latter is shown in the next section.

4 Quantitative proteomics

As an running example throughout this document, we will use a TMT 6-plex data set, PXD000001 to illustrate quantitative data processing. The code chunk below first downloads this data file from the ProteomeXchange server using the getPXD000001mzTab function from the **RforProteomics** package.

4.1 The mzTab format

The first code chunk downloads the data, reads it into R and generates an MSnSet instance and then calculates protein intensitites by summing the peptide quantitation data. Figure 2 illustates the intensities for 5 proteins.

```
## Downloads the experiment
mztab <- getPXD000001mzTab()</pre>
mztab ## the mzTab file name
[1] "./F063721.dat-mztab.txt"
## Load mzTab peptide data
qnt <- readMzTabData(mztab, what = "PEP")</pre>
Detected a metadata section
Detected a peptide section

4.3 The MALDIquant package

This section illustrates some of MALDIquant's data processing capabilities [10]. The code is taken from the processing-peaks. R script downloaded from the package home-page¹³.

Loading the data

```
## load packages
library("MALDIquant")
library("readBrukerFlexData")
library("MALDIquantForeign")
## getting test data
datapath <-
  file.path(system.file("Examples",
                        package = "readBrukerFlexData"),
            "2010_05_19_Gibb_C8_A1")
dir(datapath)
[1] "0_A1" "0_A2"
sA1 <- importBrukerFlex(datapath)</pre>
# in the following we use only the first spectrum
s < - sA1[[1]]
summary(mass(s))
  Min. 1st Qu.
                 Median
                           Mean 3rd Qu.

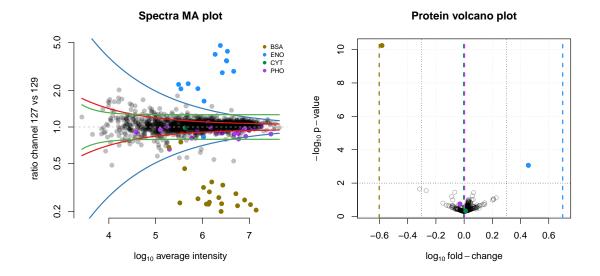

Figure 11: Result from the isobar pipeline.

4.6 The synapter package

The **synapter** package comes with a detailed vignette that describes how to prepare the MS^E data and then process it in R. Several interfaces are available provided the user with maximum control, easy batch processing capabilities or a graphical user interface. The conversion into MSnSet instances and filter and combination thereof as well as statistical analysis are also described.

```
## open the synapter vignette
library("synapter")
synapterGuide()
```

5 MS² spectra identification

A recent addition to Bioconductor 2.12 is the **rTANDEM** package, that provides a direct interface to the X!Tandem software [4]. A typical **rTANDEM** pipeline comprises

- 1. Prepare the input data.
- 2. Run the search.
- 3. Import the search results and extract the peptides and proteins

Using example code/data from the **rTANDEM** vignette/package, these steps are executed as described below.

5.1 Preparation of the input data

```
library(rTANDEM)
taxonomy <- rTTaxo(taxon = "yeast",
                    format = "peptide",
                    URL = system.file(
                       "extdata/fasta/scd.fasta.pro",
                      package="rTANDEM"))
param <- rTParam()</pre>
param <- setParamValue(param,</pre>
                          protein', 'taxon',
                         value="yeast")
param <- setParamValue(param, 'list path',</pre>
                         'taxonomy information', taxonomy)
param <- setParamValue(param,</pre>
                         'list path', 'default parameters',
                         value = system.file(
                           "extdata/default_input.xml",
                           package="rTANDEM"))
param <- setParamValue(param, 'spectrum', 'path',</pre>
                         value = system.file(
```

5.2 Performing the search

The analysis is run using the tandem function (see also the rtandem function), which returns the results data file path (only the file name is displayed below).

```
resultPath <- tandem(param)</pre>
Loading spectra

More details are provided in the vignette available with (vignette("rTANDEM")), for instance the extraction of degenerated peptides, i.e. peptides found in multiple proteins.

6 Annotation

In this section, we briefly present some Bioconductor annotation infrastruture.

We start with the **hpar** package, an interface to the *Human Protein Atlas* [13, 14], to retrieve subcellular localisation information for the ENSG00000002746 ensemble gene.

Below, we make use of the human annotation package **org.Hs.eg.db** and the Gene Ontonolgy annotation package **GO.db** to retrieve the same information as above.

```
library(org.Hs.eg.db)
library(GO.db)
ans <- select(org.Hs.eg.db, keys = id, cols = c("ENSEMBL",
    "GO", "ONTOLOGY"), keytype = "ENSEMBL")
Warning: 'select' resulted in 1:many mapping between keys and
return rows
ans <- ans[ans$ONTOLOGY == "CC", ]
ans
          ENSEMBL
                          GO EVIDENCE ONTOLOGY
2 ENSG00000002746 GD:0005634
                                  IDA
                                             CC
3 ENSG00000002746 GD:0005737
                                  TDA
                                             CC
sapply(as.list(GOTERM[ans$GO]), slot, "Term")
 GD:0005634 GD:0005737
  "nucleus" "cytoplasm"
```

Finally, this inforamtion can also be retrieved from on-line databases using the biomaRt package [6].

7 Other packages

7.1 Bioconductor packages

This section provides a complete list of packages available in the relevant Bioconductor version 2.12 (as of February 20, 2013) biocView¹⁴ categories. Tables 1, 2 and 3 represent the packages for the Proteomics (29 packages), MassSpectrometry (19 packages) and MassSpectrometryData (6 experiment packages) categories.

¹⁴http://www.bioconductor.org/packages/devel/BiocViews.html

Package	Title
ASEB	Predict Acetylated Lysine Sites
BRAIN	Baffling Recursive Algorithm for Isotope distributioN calculations
CellNO pt R	Training of boolean logic models of signalling networks using prior knowledge networks and perturbation data.
ChemmineR	Cheminformatics of Drug-like Small Molecule Data
clippda	A package for the clinical proteomic profiling data analysis
CNORdt	Add-on to CellNOptR: Discretized time treatments
CNORode	ODE add-on to CellNOptR
fmcsR	Flexible Maximum Common Substructure (FMCS) Searching
GraphPAC	Identification of Mutational Clusters in Proteins via a Graph Theoretical Approach.
hpar	Human Protein Atlas in R
iPAC	Identification of Protein Amino acid Clustering
IPPD	Isotopic peak pattern deconvolution for Protein Mass Spectrometry by template matching
LPEadj	A correction of the local pooled error (LPE) method to replace the asymptotic variance
	adjustment with an unbiased adjustment based on sample size.
${\sf MassSpecWavelet}$	Mass spectrum processing by wavelet-based algorithms
MSnbase	MSnbase: Base Functions and Classes for MS-based Proteomics
mzR	parser for netCDF, mzXML, mzData and mzML files (mass spectrometry data)
PAnnBuilder	Protein annotation data package builder
PC pheno	Phenotypes and cellular organizational units
plgem	Detect differential expression in microarray and proteomics datasets with the Power Law Global Error Model (PLGEM)
PLPE	Local Pooled Error Test for Differential Expression with Paired High-throughput Data
ppiStats	Protein-Protein Interaction Statistical Package
PROcess	Ciphergen SELDI-TOF Processing
procoil	Prediction of Oligomerization of Coiled Coil Proteins
RCASPAR	A package for survival time prediction based on a piecewise baseline hazard Cox regression model.
RpsiXML	R interface to PSI-MI 2.5 files
rTANDEM	Encapsulate X!Tandem in R.
ScISI	In Silico Interactome
SLGI	Synthetic Lethal Genetic Interaction
synapter	Label-free data analysis pipeline for optimal identification and quantitation

Table 1: Packages available under the Proteomics biocViews category.

7.2 The Chemometrics and Computational Physics CRAN Task View

The CRAN task view on Chemometrics and Computational Physics¹⁵ lists 67 packages, including a set of packages for mass spectrometry and proteomics, some of which are illustrated in this document. The most relevant (non Bioconductor) packages are summerised below.

MALDIquant provides tools for quantitative analysis of MALDI-TOF mass spectrometry data, with support for baseline correction, peak detection and plotting of mass spectra

(http://cran.r-project.org/web/packages/MALDIquant/index.html).

OrgMassSpecR is for organic/biological mass spectrometry, with a focus on graphical display, quantification using stable isotope dilution, and protein hydrogen/deuterium exchange experiments

(http://cran.r-project.org/web/packages/OrgMassSpecR/index.html).

FTICRMS provides functions for Analyzing Fourier Transform-Ion Cyclotron Resonance Mass Spectrometry Data

(http://cran.r-project.org/web/packages/FTICRMS/index.html).

¹⁵http://cran.r-project.org/web/views/ChemPhys.html

Package	Title
apComplex	Estimate protein complex membership using AP-MS protein data
BRAIN	Baffling Recursive Algorithm for Isotope distributioN calculations
CAMERA	Collection of annotation related methods for mass spectrometry data
flagme	Analysis of Metabolomics GC/MS Data
gaga	GaGa hierarchical model for high-throughput data analysis
iontree	Data management and analysis of ion trees from ion-trap mass spectrometry
MassArray	Analytical Tools for MassArray Data
MassSpecWavelet	Mass spectrum processing by wavelet-based algorithms
MSnbase	MSnbase: Base Functions and Classes for MS-based Proteomics
mzR	parser for netCDF, mzXML, mzData and mzML files (mass spectrometry data)
PROcess	Ciphergen SELDI-TOF Processing
Rdisop	Decomposition of Isotopic Patterns
Risa	Converting experimental metadata from ISA-tab into Bioconductor data structures
RMassBank	Workflow to process tandem MS files and build MassBank records
rols	An R interface to the Ontology Lookup Service
rTANDEM	Encapsulate X!Tandem in R.
synapter	Label-free data analysis pipeline for optimal identification and quantitation
TargetSearch	A package for the analysis of GC-MS metabolite profiling data.
xcms	LC/MS and GC/MS Data Analysis

Table 2: Packages available under the MassSpectrometry biocViews category.

Package	Title
faahKO	Saghatelian et al. (2004) FAAH knockout LC/MS data
gcspikelite	Spike-in data for GC/MS data and methods within flagme
msdata	Various Mass Spectrometry raw data example files
RforProteomics	Companion package to the 'Using R and Bioconductor for proteomics data analysis' publication
RMassBankData	Test dataset for RMassBank
synapterdata	Data accompanying the synapter package

Table 3: Experimental Packages available under the MassSpectrometryData biocViews category.

titan provides a GUI to analyze mass spectrometric data on the relative abundance of two substances from a titration series

(http://cran.r-project.org/web/packages/titan/index.html).

7.3 Other CRAN packages

Finally, digeR¹⁶, which is available on CRAN but not listed in the Chemometrics and Computational Physics Task View, provides a GUI interface for analyzing 2D DIGE data. It allows to perform correlation analysis, score plot, classification, feature selection and power analysis for 2D DIGE experiment data.

¹⁶http://cran.r-project.org/web/packages/digeR/index.html

8 Session information

All software and respective versions used in this document, as returned by sessionInfo() are detailed below.
