Using R and Bioconductor for Proteomics Data Analysis

Laurent Gatto*, Thomas Lin Perdersen, Sebastian Gibb

October 1, 2014

Abstract

This vignette shows and executes the code presented in the manuscript $Using\ R$ for proteomics data analysis. It also aims at being a general overview for users who wish to explore the R environment and programming language for the analysis of proteomics data.

Keywords: proteomics, mass spectrometry, tutorial.

1 Introduction

This document illustrates some existing R infrastructure for the analysis of proteomics data. It presents the code for the use cases taken from [1]. A pre-print of the manuscript is available on arXiv¹.

There are however numerous additional R resources distributed by the $Bioconductor^2$ and $CRAN^3$ repositories, as well as packages hosted on personal websites. Section 8 on page 37 tries to provide a wider picture of available packages, without going into details.

1.1 General R resources

The reader is expected to have basic R knowledge to find the document helpful. There are numerous R introductions freely available, some of which are listed below.

From the *R* project web-page:

- An Introduction to R is based on the former *Notes on R*, gives an introduction to the language and how to use R for doing statistical analysis and graphics. [browse HTML download PDF]
- Several introductory tutorials in the contributed documentation section.
- The TeachingMaterial repository contains several sets of slides and vignettes about R programming.

Relevant background on the R software and its application to computational biology in general and proteomics in particular can also be found in [1]. For details about the *Bioconductor* project, the reader is referred to [2].

1.2 Getting help

All *R* packages come with ample documentation. Every command (function, class or method) a user is susceptible to use is documented. The documentation can be accessed by preceding the command by a ? in the *R* console. For example, to obtain help about the library function, that will be used in the next section, one would type ?library. In addition, all *Bioconductor* packages come with at least one vignette (this document is the vignette that comes with the *RforProteomics* package), a document that combines text and *R* code that is executed before the pdf is assembled. To look up all vignettes that come with a package, say *RforProteomics* and then open the vignette of interest, one uses the vignette function as illustrated below. More details can be found in ?vignette.

```
## list all the vignettes in the RforProteomics package
vignette(package = "RforProteomics")
## Open the vignette called RforProteomics
vignette("RforProteomics", package = "RforProteomics")
## or just
vignette("RforProteomics")
```

R has several mailing lists⁵. The most relevant here being the main R-help list, for discussion about problem and solutions using R. This one is for general R content and is not suitable for bioinformatics or proteomics questions. Bioconductor also offers several mailing lists⁶ dedicated to bioinformatics matters and Bioconductor packages. The main Bioconductor list is the most relevant one. It is possible to post⁷ questions without subscribing to the list. Finally, the dedicated RforProteomics Google group⁸ welcomes questions/comments/annoucements related to R and mass-spectrometry/proteomics.

```
1http://arxiv.org/abs/1305.6559
2http://www.bioconductor.org
3http://cran.r-project.org/web/packages/
4https://github.com/lgatto/TeachingMaterial
5http://www.r-project.org/mail.html
6http://bioconductor.org/help/mailing-list/
7http://bioconductor.org/help/mailing-list/mailform/
8https://groups.google.com/forum/#!forum/rbioc-sig-proteomics
```

It is important to read and comply to the posting guides (here and here) to maximise the chances to obtain good responses. It is important to specify the software versions using the sessionInfo() functions (see an example output at the end of this document, on page 40). It the question involves some code, make sure to isolate the relevant portion and report it with your question, trying to make your code/example reproducible⁹.

All lists have browsable archives.

1.3 Installation

The package should be installed using as described below:

```
## only first time you install Bioconductor packages
source("http://www.bioconductor.org/biocLite.R")
## else
library("BiocInstaller")
biocLite("RforProteomics")
```

To install all dependencies and reproduce the code in the vignette, replace the last line in the code chunk above with:)

```
biocLite("RforProteomics", dependencies = TRUE)
```

Finally, the package can be loaded with

```
library("RforProteomics")
##
## This is the 'RforProteomics' version 1.3.5.
##
##
   To get started, visit
##
      http://lgatto.github.com/RforProteomics/
##
    or, in R, open package vignettes by typing
##
      RforProteomics() # R/Bioc for proteomics overview
##
##
      ProtViz()
                       # R/Bioc for proteomics visualisation
```

See also the *RforProteomics* web page¹⁰ for more information on installation.

1.4 External dependencies

Some packages used in the document depend on external libraries that need to be installed prior to the R packages:

mzR depends on the Common Data Format¹¹ (CDF) to CDF-based raw mass-spectrometry data. On Linux, the libcdf library is required. On Debian-based systems, for instance, one needs to install the libnetcdf-dev package.

IPPD (and others) depend on the *XML* package which requires the libxml2 infrastructure on Linux. On Debian-based systems, one needs to install libxml2-dev.

biomaRt performs on-line requests using the curl¹² infrastructure. On Debian-based systems, you one needs to install libcurl-dev or libcurl4-openssl-dev.

MSGFplus Is based on the MS-GF+ java program and thus requires Java 1.7¹³ in order to work.

```

10http://lgatto.github.io/RforProteomics/
11http://cdf.gsfc.nasa.gov/
12http://curl.haxx.se/
13https://java.com
```

1.5 Obtaining the code

The code in this document describes all the examples presented in [1] and can be copy, pasted and executed. It is however more convenient to have it in a separate text file for better interaction with R (using ESS¹⁴ for Emacs or RStudio¹⁵ for instance) to easily modify and explore it. This can be achieved with the Stangle function. One needs the Sweave source of this document (a document combining the narration and the R code) and the Stangle then specifically extracts the code chunks and produces a clean R source file. If the package is installed, the following code chunk will create a RforProteomics.R file in your working directory containing all the annotated source code contained in this document.

Alternatively, you can obtain the Rnw file on the github page https://github.com/lgatto/RforProteomics/blob/master/inst/doc/vigsrc/RforProteomics.Rnw.

1.6 Prepare the working environment

The packages that we will depend on to execute the examples will be loaded in the respective sections. Here, we pre-load packages that provide general functionality used throughout the document.

```
library("RColorBrewer") ## Color palettes
library("ggplot2") ## Convenient and nice plotting
library("reshape2") ## Flexibly reshape data
```

2 Data standards and input/output

2.1 The mzR package

The mzR package [3] provides a unified interface to various mass spectrometry open formats. This code chunk, taken mainly from the openMSfile documentation illustrated how to open a connection to an raw data file. The example mzML data is taken from the msdata data package. The code below would also be applicable to an mzXML, mzData or netCDF file.

¹⁴http://ess.r-project.org/

¹⁵http://rstudio.org/

```
## [1] "MM14.mzML"
isInitialized(mz)
## [1] TRUE
runInfo(mz)
## $scanCount
## [1] 112
##
## $lowMz
## [1] 0
##
## $highMz
## [1] 0
##
## $dStartTime
## [1] 270.334
## $dEndTime
## [1] 307.678
##
## $msLevels
## [1] 1
instrumentInfo(mz)
## $manufacturer
## [1] "Unknown"
##
## $model
## [1] "instrument model"
## $ionisation
## [1] "electrospray ionization"
## $analyzer
## [1] "mass analyzer type"
##
## $detector
## [1] "detector type"
## once finished, it is good to explicitely
## close the connection
close(mz)
```

mzR is used by other packages, like MSnbase [4], TargetSearch [5] and xcms [6, 7, 8], that provide a higher level abstraction to the data.

2.2 Handling MS² identification data with mzID

The mzID package allows to load and manipulate MS² data in the mzIdentML format. The main mzID function reads such a file and constructs an instance of class mzID.

```
library("mzID")
id <- mzID("http://psi-pi.googlecode.com/svn/trunk/examples/1_1examples/55merge_tandem.mzid")</pre>
```

```
## reading 55merge_tandem.mzid... DONE!
id

## An mzID object
##
## Software used: X\!Tandem (version: x! tandem CYCLONE (2010.06.01.5))
##
## Rawfile: D:/TestSpace/NeoTestMarch2011/55merge.mgf
##
## Database: D:/Software/Databases/Neospora_3rndTryp/Neo_rndTryp_3times.fasta.pro
##
## Number of scans: 169
## Number of PSM's: 170
```

Multiple files can be parsed in one go, possibly in parallel if the environment supports it. When this is done an mzIDCollection object is returned:

```
ids <- mzID(c(
    "http://psi-pi.googlecode.com/svn/trunk/examples/1_1examples/55merge_tandem.mzid",
    "http://psi-pi.googlecode.com/svn/trunk/examples/1_1examples/55merge_omssa.mzid"))
ids
## An mzIDCollection object containing 2 samples</pre>
```

Peptides, scans, parameters, ...can be extracted with the respective pepetides, scans, parameters, ...functions. The mzID object can also be converted into a data.frame using the flatten function.

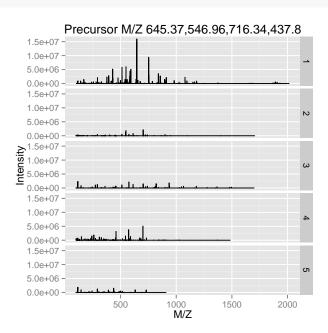

```
fid <- flatten(id)
names(fid)
## [1] "spectrumid"
                                   "spectrum title"

dim(fid)
## [1] 171 22
```

3 Raw data abstraction with MSnExp objects

MSnbase [4] provides base functions and classes for MS-based proteomics that allow facile data and meta-data processing, manipulation and plotting (see for instance figure 1 on page 9).

```
basename(mzXML)
## [1] "dummyiTRAQ.mzXML"
## reads the raw data into and MSnExp instance
raw <- readMSData(mzXML, verbose = FALSE)</pre>
raw
## Object of class "MSnExp"
## Object size in memory: 0.2 Mb
## - - - Spectra data - - -
## MS level(s): 2
## Number of MS1 acquisitions: 1
## Number of MSn scans: 5
## Number of precursor ions: 5
## 4 unique MZs
## Precursor MZ's: 437.8 - 716.34
## MSn M/Z range: 100 2016.66
## MSn retention times: 25:1 - 25:2 minutes
## - - - Processing information - - -
## Data loaded: Wed Oct 1 17:58:49 2014
## MSnbase version: 1.13.15
## - - - Meta data - - -
## phenoData
## rowNames: 1
## varLabels: sampleNames
## varMetadata: labelDescription
## Loaded from:
## dummyiTRAQ.mzXML
## protocolData: none
## featureData
## featureNames: X1.1 X2.1 ... X5.1 (5 total)
## fvarLabels: spectrum
## fvarMetadata: labelDescription
## experimentData: use 'experimentData(object)'
## Extract a single spectrum
raw[[3]]
## Object of class "Spectrum2"
## Precursor: 645.3741
## Retention time: 25:2
## Charge: 2
## MSn level: 2
## Peaks count: 2125
## Total ion count: 150838188
```

plot(raw, full=TRUE)

plot(raw[[3]], full=TRUE, reporters=iTRAQ4)

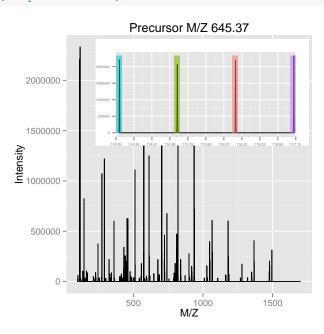

Figure 1: The plot method can be used on experiments, i.e. spectrum collections (top), or individual spectra (bottom).

3.1 mgf read/write support

Read and write support for data in the mgf¹⁶ and mzTab¹⁷ formats are available via the readMgfData/writeMgfData and readMzTabData/writeMzTabData functions, respectively. An example for the latter is shown in the next section.

4 Quantitative proteomics

As an running example throughout this document, we will use a TMT 6-plex data set, PXD000001 to illustrate quantitative data processing. The code chunk below first downloads this data file from the ProteomeXchange server using the *rpx* package.

4.1 The mzTab format

The first code chunk downloads the mzTab data from the ProteomeXchange repository [9].

```
## Experiment information
library("rpx")
px1 <- PXDataset("PXD000001")</pre>
px1
## Object of class "PXDataset"
## Id: PXD000001 with 8 files
## [1] 'F063721.dat' ... [8] 'erwinia_carotovora.fasta'
## Use 'pxfiles(.)' to see all files.
pxfiles(px1)
## [1] "F063721.dat"
## [2] "F063721.dat-mztab.txt"
## [3] "PRIDE_Exp_Complete_Ac_22134.xml.gz"
## [4] "PRIDE_Exp_mzData_Ac_22134.xml.gz"
## [5] "PXD000001_mztab.txt"
## [6] "TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01.mzXML"
## [7] "TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01.raw"
## [8] "erwinia_carotovora.fasta"
## Downloading the mzTab data
mztab <- pxget(px1, "PXD000001_mztab.txt")</pre>
## Downloading 1 file
## PXD000001_mztab.txt already present.
mztab
## [1] "PXD000001_mztab.txt"
```

The code below loads the mzTab file into R and generates an MSnSet instance, removes missing values and calculates protein intensities by summing the peptide quantitation data. Figure 2 illustrates the intensities for 5 proteins.

```
## Load mzTab peptide data
qnt <- readMzTabData(mztab, what = "PEP")
## Warning: Support for mzTab version 0.9 only. Support will be added soon.</pre>
```

  labs(x = "Reporters", y = "Normalised intensity")
```

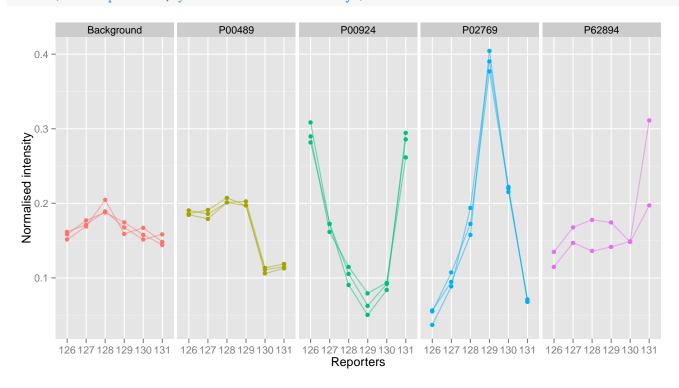

Figure 4: Spikes plot using ggplot2.

4.2 Working with raw data

We reuse our dedicated px1 ProteomeXchange data object to download the raw data (in mzXML format) and load it with the readMSData from the MSnbase package that produces a raw data experiment object of class MSnExp. The raw data is then quantified using the quantify method specifying the TMT 6-plex isobaric tags and a 7^{th} peak of interest corresponding to the un-dissociated reporter tag peaks (see the MSnbase-demo vignette in MSnbase for details).

```
mzxml <- pxget(px1, "TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01.mzXML")</pre>
## Downloading 1 file
## TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01.mzXML already present.
rawms <- readMSData(mzxml, centroided = TRUE, verbose = FALSE)
qntms <- quantify(rawms, reporters = TMT7, method = "max")</pre>
## Using default parallel backend: MulticoreParam
## Original MSnExp and new MSnSet have different number of samples in phenoData. Dropping original.
## Creating 'MSnSet' object
qntms
## MSnSet (storageMode: lockedEnvironment)
## assayData: 6103 features, 7 samples
## element names: exprs
## protocolData: none
## phenoData
    sampleNames: TMT7.126 TMT7.127 ... TMT7.230 (7
##
##
      total)
##
    varLabels: mz reporters
## varMetadata: labelDescription
## featureData
    featureNames: X1000.1 X100.1 ... X999.1 (6103
##
##
      total)
## fvarLabels: spectrum file ... collision.energy (12
##
      total)
##
    fvarMetadata: labelDescription
## experimentData: use 'experimentData(object)'
## Annotation: No annotation
## - - - Processing information - - -
## Data loaded: Wed Oct 1 17:20:45 2014
## TMT7 quantification by max: Wed Oct 1 17:25:03 2014
## MSnbase version: 1.13.15
```

Identification data in the mzIdentML format can be added to MSnExp or MSnSet instances with the addIdentificationData function. See the function documentation for examples.

```
pch[grep("P00489", fData(qnt)$accession)] <- 19
mzp <- plotMzDelta(rawms, reporters = TMT6, verbose = FALSE) + ggtitle("")
mzp</pre>
```

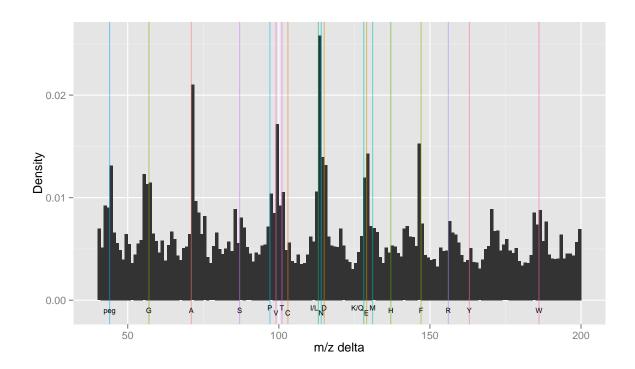

Figure 5: A m/z delta plot.

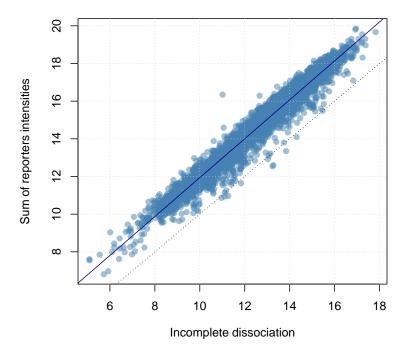

Figure 6: Incomplete dissociation.

MAplot(qnt[, c(4, 2)], cex = .9, col = cls, pch = pch, show.statistics = FALSE)

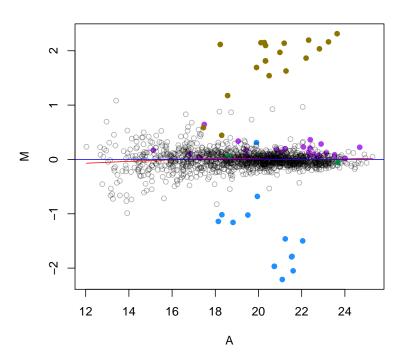

Figure 7: MAplot on an MSnSet instance.

4.3 The MALDIquant package

This section illustrates some of *MALDIquant*'s data processing capabilities [10]. The code is taken from the processing-peaks.R script downloaded from the package homepage¹⁸.

Loading the data

```
## load packages
library("MALDIquant")
library("MALDIquantForeign")
## getting test data
datapath <-
  file.path(system.file("Examples",
                       package = "readBrukerFlexData"),
            "2010_05_19_Gibb_C8_A1")
dir(datapath)
## [1] "O_A1" "O_A2"
sA1 <- importBrukerFlex(datapath, verbose=FALSE)</pre>
# in the following we use only the first spectrum
s <- sA1[[1]]
summary(mass(s))
##
     Min. 1st Qu. Median Mean 3rd Qu.
                                              Max.
     999.9 2373.0 4331.0 4721.0 6874.0 10000.0
summary(intensity(s))
     Min. 1st Qu. Median Mean 3rd Qu.
                                             Max.
        4
              180
                     1562 2841 4656 32590
##
head(as.matrix(s))

```

The following code chunks demonstrate how to use the *cleaver* package for in-silico cleavage of polypeptides, e.g. cleaving of *Gastric juice peptide 1 (P01358)* using *Trypsin*:

```
library(cleaver)
cleave("LAAGKVEDSD", enzym = "trypsin")
## $LAAGKVEDSD
## [1] "LAAGK" "VEDSD"
```

Sometimes cleavage is not perfect and the enzym miss some cleavage positions:

```
## miss one cleavage position
cleave("LAAGKVEDSD", enzym = "trypsin", missedCleavages = 1)

## $LAAGKVEDSD

## [1] "LAAGKVEDSD"

## miss zero or one cleavage positions
cleave("LAAGKVEDSD", enzym = "trypsin", missedCleavages = 0:1)

## $LAAGKVEDSD

## [1] "LAAGK" "VEDSD" "LAAGKVEDSD"
```

Example code to generate an Texshade image to be included directly in a Latex document or R vignette is presented below. The R code generates a Texshade environment and the annotated sequence display code that is written to a TEX file that can itself be included into a LATEX of Sweave document.

```
seq1file <- "seq1.tex"
cat("\\begin{texshade}{Figures/P00924.fasta}
      \\setsize{numbering}{footnotesize}
      \\setsize{residues}{footnotesize}
      \\residuesperline*{70}
      \\shadingmode{functional}
      \\hideconsensus
      \\vsepspace{1mm}
      \\hidenames
     \\noblockskip\n", file = seq1file)
tmp <- sapply(1:nrow(pepcnt), function(i) {
  col <- ifelse((i %% 2) == 0, "Blue", "RoyalBlue")</pre>
  cat("\shaderegion(1){", pepcnt$start[i], "..", pepcnt$stop[i], "}{White}{", col, "}\n", file = seq1file, append = TRUE)
cat("\\end{texshade}
    \\caption{Visualising observed peptides for the Yeast enclase protein. Peptides are shaded in blue and black.
                The last peptide is a mis-cleavage and overlaps with \mathsf{TEEELGDNAVFAGENFHHGDK}.

              CYT = 1/1)
```

Spectra MA plot

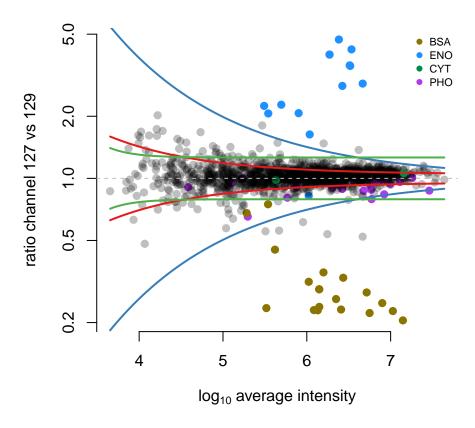

Figure 11: Result from the isobar pipeline.

4.6 The synapter package

The synapter [12] package comes with a detailed vignette that describes how to prepare the MS^E data and then process it in R. Several interfaces are available provided the user with maximum control, easy batch processing capabilities or a graphical user interface. The conversion into MSnSet instances and filter and combination thereof as well as statistical analysis are also described.

```
## open the synapter vignette
library("synapter")
synapterGuide()
```

5 MS² spectra identification

At the moment two packages allow the user to run peptide identifications from within R. Each of the packages interface to an external peptide database search tool and have more or less the same workflow, though their syntax differs:

- 1. Prepare the input data.
- 2. Run the search.
- 3. Import the search results and extract the peptides and proteins

5.1 X! Tandem

Following Bioconductor 2.12 the rTANDEM package provides the means to run the popular X! Tandem software [13]. Using example code/data from the rTANDEM vignette/package, the following is an example of a typical workflow

5.1.1 Preparation of the input data

```
library(rTANDEM)
taxonomy <- rTTaxo(taxon = "yeast",</pre>
                    format = "peptide",
                    URL = system.file(
                       "extdata/fasta/scd.fasta.pro",
                       package="rTANDEM"))
param <- rTParam()</pre>
param <- setParamValue(param,</pre>
                         'protein', 'taxon',
                         value="yeast")
param <- setParamValue(param, 'list path',</pre>
                         'taxonomy information', taxonomy)
param <- setParamValue(param,</pre>
                         'list path', 'default parameters',
                         value = system.file(
                           "extdata/default_input.xml",
                           package="rTANDEM"))
param <- setParamValue(param, 'spectrum', 'path',</pre>
                         value = system.file(
                           "extdata/test_spectra.mgf",
                           package="rTANDEM"))
param <- setParamValue(param, 'output', 'xsl path',</pre>
                         value = system.file(
                           "extdata/tandem-input-style.xsl",
```

5.1.2 Performing the search

The analysis is run using the tandem function (see also the rtandem function), which returns the results data file path (only the file name is displayed below).

```
resultPath <- tandem(param)</pre>
## Loading spectra
## (mgf). loaded.
## Spectra matching criteria = 242
## Starting threads . started.
## Computing models:
## testin
## sequences modelled = 5 ks
## Model refinement:
## partial cleavage ..... done.
## unanticipated cleavage ..... done.
## modified N-terminus .... done.
## finishing refinement ... done.
## Creating report:
## initial calculations .... done.
## sorting .... done.
## finding repeats ..... done.
## evaluating results ..... done.
## calculating expectations ..... done.
## writing results ..... done.
##
## Valid models = 40
## Unique models = 41
## Estimated false positives = 1 + /- 1
basename(resultPath)
## [1] "output.2014_10_01_17_59_04.t.xml"
```

5.1.3 Import and analyse results

```
res <- GetResultsFromXML(resultPath)</pre>
## the inferred proteins
proteins <- GetProteins(res,</pre>
                       log.expect = -1.3,
                       min.peptides = 2)

```

More details are provided in the vignette available with (vignette("rTANDEM")), for instance the extraction of degenerated peptides, i.e. peptides found in multiple proteins.

The *shinyTANDEM* package offers a web-based graphical interface to *rTANDEM*.

5.2 MS-GF+

With the release of Bioconductor 3.0 the MSGFplus package has provided an interface to MS-GF+ [14, 15]. The package vignette describe in detail the different ways an MS-GF+ analysis can be initiated and only a simple example will be given here:

5.2.1 Preparation of the input data

```
composition = 'C2H3N101',
                                         residues = 'C',
                                         type = 'fix',
                                         position = 'any')
                    # Number of allowed modifications per peptide
nMod(param) <- 2</pre>
## Get a summary of your parameters
show(param)
## An msgfPar object
##
## Database:
                                /home/lg390/R/x86_64-unknown-linux-gnu-library/3.2/MSGFplus/extdata/milk-pr
## Tolerance:
                                10 ppm
## TDA:
                                TRUE
## Instrument:
                                3: QExactive
## Enzyme:
                                1: Trypsin
##
## Modifications:
##
## Number of modifications per peptide: 2
##
## Carbamidomethyl: C2H3N1O1, C, fix, any
```

5.2.2 Performing the search

Initiating the search is done using the runMSGF method. As a minimum it takes a parameter object and a list of raw data files and performs the search for each data file in sequence. More specialised operations are also possible such as running it asynchronously, but interested readers should refer to the *MSGFplus* vignette for additional information.

The first time a search is initialised the MS-GF+ code is downloaded, so be sure to have an active internet connection (only applies to the first time a search is run).

```
result <- runMSGF(param, 'path/to/a/rawfile.mzML')</pre>
```

5.2.3 Import and analyse results

By default MSGFplus imports the results automatically using *mzlD*. If only one file was analysed, the return value is an mzlD object; if multiple files are analysed at once the return value is an mzlDCollection object.

If import=FALSE the results are not imported and can be accessed at a later time using the mzID package (see below).

5.2.4 Running MS-GF+ through a GUI

MSGFplus comes with a sister package, *MSGFgui*, which provide a graphic interface to setting up and running MS-GF+ through *R. MSGFgui* is currently available on GitHub¹⁹ and will become available in Bioconductor in the the release. Besides facilitating MS-GF+ analyses, which is arguably just as easy from the command line, it provides an intuitive way to investigate and evaluate the resulting identification data.

Figure 12 shows an example of using *MSGFgui*. It is possible to gradually drill down in the results starting from the protein level and ending at the raw spectrum level. mzldentML files already created with MS-GF+ (using *MSGFplus* or in other ways) can easily be imported into the gui to take advantage of the visualisation features, and results can be exported as either rds (for R), xlsx (for excel) or txt (for everything else) files.

¹⁹https://github.com/thomasp85/MSGFgui

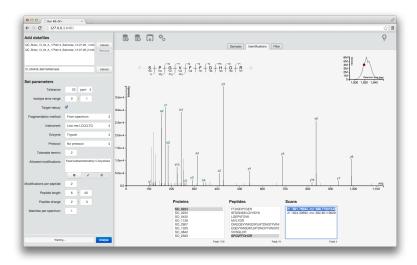

Figure 12: A screenshot of MSGFgui

6 Quality control

Quality control (QC) is an essential part of any high throughput data driven approach. Bioconductor has a rich history of QC for various genomics data and currently two packages support proteomics QC.

proteoQC provides a dedicated a dedicated pipeline that will produce a dynamic and extensive html report. It uses the *rTANDEM* package to automate the generation of identification data and uses information about the experimental/replication design.

The *qcmetrics* package is a general framework to define QC metrics and bundle them together to generate html or pdf reports. It provides some ready made metrics for MS data and 15 N labelled data.

7 Annotation

In this section, we briefly present some *Bioconductor* annotation infrastructure.

We start with the *hpar* package, an interface to the *Human Protein Atlas* [16, 17], to retrieve subcellular localisation information for the ENSG00000002746 ensemble gene.

```
id <- "ENSG00000002746"
library("hpar")
getHpa(id, "SubcellularLoc")

## Gene Main.location
## 25 ENSG00000002746 Nucleus but not nucleoli; Cytoplasm
## Other.location Expression.type Reliability
## 25 APE High</pre>
```

Below, we make use of the human annotation package *org.Hs.eg.db* and the Gene Ontology annotation package *GO.db* to retrieve the same information as above.

Finally, this information can also be retrieved from on-line databases using the biomaRt package [18].

```
library("biomaRt")
ensembl <- useMart("ensembl",dataset="hsapiens_gene_ensembl")
efilter <- "ensembl_gene_id"
eattr <- c("go_id", "name_1006", "namespace_1003")
bmres <- getBM(attributes=eattr, filters = efilter, values = id, mart = ensembl)
bmres[bmres$namespace_1003 == "cellular_component", "name_1006"]
## [1] "cytoplasm" "nucleus"</pre>
```

8 Other packages

8.1 Bioconductor packages

This section provides a complete list of packages available in the relevant *Bioconductor* version 3.0 (as of October 1, 2014) biocView²⁰ categories. Tables 1, 2 and 3 represent the packages for the Proteomics (59 packages), MassSpectrometry (37 packages) and MassSpectrometryData (7 experiment packages) categories.

Package	Title	Version
ASEB	Predict Acetylated Lysine Sites	1.9.2
bioassayR	R library for Bioactivity analysis	1.3.2
BRAIN	Baffling Recursive Algorithm for Isotope distribution calculations	1.11.0
CellNOptR	Training of boolean logic models of signalling networks using prior knowledge networks and	1.11.1
Chamain aD	perturbation data.	2 17 10
ChemmineR	Cheminformatics Toolkit for R	2.17.19
cisPath	Visualization and management of the protein-protein interaction networks.	1.5.8
cleaver	Cleavage of Polypeptide Sequences	1.3.8
clippda	A package for the clinical proteomic profiling data analysis	1.15.1
CNORdt	Add-on to CellNOptR: Discretized time treatments	1.7.0
CNORfeeder CNORode	Integration of CellNOptR to add missing links ODE add-on to CellNOptR	1.5.0
customProDB	Generate customized protein database from NGS data, with a focus on RNA-Seq data, for	1.7.0
CustomProDB	proteomics search.	1.5.5
dalka Casa	·	1.5.0
deltaGseg	deltaGseg	
eiR fmcsR	Accelerated similarity searching of small molecules Migmatch Talarant Maximum Common Substructure Searching	1.5.7 1.7.8
GraphPAC	Mismatch Tolerant Maximum Common Substructure Searching Identification of Mutational Clusters in Proteins via a Graph Theoretical Approach.	1.7.0
	Human Protein Atlas in R	1.7.0
hpar iPAC		
IPPD	Identification of Protein Amino acid Clustering Isotopic peak pattern deconvolution for Protein Mass Spectrometry by template matching	1.9.0 1.13.0
isobar	Analysis and quantitation of isobarically tagged MSMS proteomics data	1.11.0
LPEadj	A correction of the local pooled error (LPE) method to replace the asymptotic variance	1.25.0
M C \ \ / l - t	adjustment with an unbiased adjustment based on sample size.	1 21 0
MassSpecWavelet	Mass spectrum processing by wavelet-based algorithms	1.31.0
msmsEDA	Exploratory Data Analysis of LC-MS/MS data by spectral counts	1.3.0
msmsTests MSnbase	LC-MS/MS Differential Expression Tests	1.3.0
	MSnbase: Base Functions and Classes for MS-based Proteomics	1.13.16 0.99.4
MSnID MSatata	Utilities for Exploration and Assessment of Confidence of LC-MSn Proteomics Identifications.	
MSstats	Protein Significance Analysis in DDA, SRM and DIA for Label-free or Label-based Proteomics	2.3.0
mzID	Experiments	1 2 6
	An mzldentML parser for R	1.3.6
mzR	parser for netCDF, mzXML, mzData and mzML and mzIdentML files (mass spectrometry	1.99.1
DA D!!!	data)	1 00 0
PAnnBuilder	Protein annotation data package builder	1.29.0
pathview	a tool set for pathway based data integration and visualization	1.5.4
Pbase	Manipulating and exploring protein and proteomics data	0.2.1 1.27.0
PCpheno	Phenotypes and cellular organizational units	
plgem	Detect differential expression in microarray and proteomics datasets with the Power Law	1.37.1
DLDE	Global Error Model (PLGEM)	1 25 0
PLPE	Local Pooled Error Test for Differential Expression with Paired High-throughput Data	1.25.0
ppiStats	Protein-Protein Interaction Statistical Package	1.31.1
PROcess	Ciphergen SELDI-TOF Processing	1.41.0
procoil Dra CaNA	Prediction of Oligomerization of Coiled Coil Proteins	1.15.0
ProCoNA	Protein co-expression network analysis (ProCoNA).	1.3.0
pRoloc	A unifying bioinformatics framework for spatial proteomics	1.5.17
pRolocGUI	Interactive visualisation of spatial proteomics data	0.99.11 1.3.0
prot2D	Statistical Tools for volume data from 2D Gel Electrophoresis	1.3.0
proteoQC	An R package for proteomics data quality control Peptide Annotation and Data Visualization using Gviz	
Pviz	A Framework for Quality Control	0.99.0
qcmetrics rain	Rhythmicity Analysis Incorporating Non-parametric Methods	1.3.1 0.99.5
RCASPAR	A package for survival time prediction based on a piecewise baseline hazard Cox regression	
RCASPAR	, ,	1.11.0
Dahamann	model.	221
Rchemcpp	Similarity measures for chemical compounds	2.3.1
Rcpi	Toolkit for Compound-Protein Interaction in Drug Discovery	1.1.0
RpsiXML	R interface to PSI-MI 2.5 files R Interface to the ProteomeXchange Repository	2.7.0
rpx ~TANDEM		1.1.1
rTANDEM	Interfaces the tandem protein identification algorithm in R	1.5.1
sapFinder	A package for variant peptides detection and visualization in shotgun proteomics.	1.3.1
ScISI	In Silico Interactome	1.37.1
shinyTANDEM	Provides a GUI for rTANDEM	1.3.0
SLGI	Synthetic Lethal Genetic Interaction	1.25.0
SpacePAC	Identification of Mutational Clusters in 3D Protein Space via Simulation.	1.3.0
spliceSites	Manages align gap positions from RNA-seq data	1.3.0

 $^{^{20} {\}tt http://www.bioconductor.org/packages/devel/BiocViews.html}$

synapter	Label-free data analysis pipeline for optimal identification and quantitation	1.7.0

TargetSearch A package for the analysis of GC-MS metabolite profiling data. 1.21.1	shinyTANDEM	Provides a GUI for rTANDEM	1.3.0
	synapter		1.7.0
xcms LC/MS and GC/MS Data Analysis 1.41.0	TargetSearch	A package for the analysis of GC-MS metabolite profiling data.	1.21.1
	xcms	LC/MS and GC/MS Data Analysis	1.41.0

Table 2: Packages available under the MassSpectrometry biocViews category.

Pаскаge	i itie	version
faahKO	Saghatelian et al. (2004) FAAH knockout LC/MS data	1.5.5
gcspikelite	Spike-in data for GC/MS data and methods within flagme	1.3.0
metaMSdata	Example CDF data for the metaMS package	1.1.0
msdata	Various Mass Spectrometry raw data example files	0.3.2
RforProteomics	Companion package to the 'Using R and Bioconductor for proteomics data analysis' publication	1.3.4
RMassBankData	Test dataset for RMassBank	1.3.0
synapterdata	Data accompanying the synapter package	1.3.1

 ${\bf Table~3:~Experimental~Packages~available~under~the~MassSpectrometryData~\itbiocViews~category.}$

The tables can easily be generated with the proteomicsPackages, massSpectrometryPackages and massSpectrometryDataPackage functions. The respective package tables can then be interactively explored using the display function.

```
pp <- proteomicsPackages()
display(pp)</pre>
```

8.2 Other CRAN packages

The CRAN task view on Chemometrics and Computational Physics²¹ is another useful ressource listing 73 packages, including a set of packages for mass spectrometry and proteomics, some of which are illustrated in this document.

MALDIquant provides tools for quantitative analysis of MALDI-TOF mass spectrometry data, with support for baseline correction, peak detection and plotting of mass spectra

(http://cran.r-project.org/web/packages/MALDIquant/index.html).

OrgMassSpecR is for organic/biological mass spectrometry, with a focus on graphical display, quantification using stable isotope dilution, and protein hydrogen/deuterium exchange experiments

(http://cran.r-project.org/web/packages/OrgMassSpecR/index.html).

FTICRMS provides functions for Analyzing Fourier Transform-Ion Cyclotron Resonance Mass Spectrometry Data (http://cran.r-project.org/web/packages/FTICRMS/index.html).

titan provides a GUI to analyze mass spectrometric data on the relative abundance of two substances from a titration series

(http://cran.r-project.org/web/packages/titan/index.html).

digeR provides a GUI interface for analysing 2D DIGE data. It allows to perform correlation analysis, score plot, classification, feature selection and power analysis for 2D DIGE experiment data.

(http://cran.r-project.org/web/packages/digeR/index.html)

protViz helps with quality checks, visualizations and analysis of mass spectrometry data, coming from proteomics experiments. The package is developed, tested and used at the Functional Genomics Center Zurich.

(http://cran.r-project.org/web/packages/protViz/index.html)

Suggestions for additional R packages are welcome and will be added to the vignette. Please send suggestions and possibly a short description and/or a example utilisation with code to lg390@cam.ac.uk. The only requirement is that the package must be available on an official package channel (CRAN, *Bioconductor*, R-forge, Omegahat), i.e. not only available through a personal web page.
